

## ABSTRACT

[Abstract]

[Object]

An object is to separate presentation data and presentation logic from each other in a template system so as not to be mixed within a single template. According to the present invention, in presentation data D that constitutes a presentation layer P, a mark of any kind is attached to a portion to be changed. Then, the portion to be changed is abstracted into start part/intermediate part/end part. Further, in presentation logic L, each or all of the start part, the intermediate part, and the end part in the presentation data D is adopted as an operation target, so that the separation between the presentation data D and the presentation logic L is implemented.
